50 families engaged in Triple P training

● Group Triple P ● Discussion ● Primary Care Triple P

Baby Massage

62%

of families attended baby massage classes

CONTAMINATION

Did the low treatment group receive the high treatment supports?

The potential for contamination was high in *PFL* as it took place in a small community where families in the high and low treatment groups may have known each other. However, our measures of contamination found that the low treatment families did not benefit from the supports offered to the high treatment families.
